How to execute Operation Sahure from the command prompt:

The project directory should contain at least the following:
- bin folder containing compiled class files.
- An input.txt file with a list of cases to be analyzed.
- Various input TXT files containing pyramid network data.
- Empty directory named "output" where OUT files will be generated.

To execute this program from the command line:

1) Navigate to the project directory using the "cd" command.
2) Run the following command:

            java -cp bin main.OperationSahure

3) If the program is executed successfully, a dialog box should pop up and your results will be found in the "output" directory.

*main.OperationSahure specifies the package and class which contains the main method.
